MicroBlaze-V-Zephyr-Kria-OpenAMP

Getting Started Guide, document revision v1.0

A. Preparing the KR260 and Sensor Setup

1. **Purchase the KR260 and Pmod Accessories**
    a. KR260 Board , power adapter , 16+ GB of SD Card – Purchase Link from AMD
    b. Pmod Acl – Digilent Link
    c. Pmod TMP2 – Digilent Link
    d. Pmod GPIO 8 bit LED – Digilent Link
    e. Pmod UART – Digilent Link
    f. Few Male to female jumpers – Amazon or can be purchased from any electronics shop.

2. **Preparing the KR260 Board with Ubuntu 22.04 LTS image**
    a. Follow the "**Booting Kria Starter Kit Linux on KR260**" steps from here - https://xilinx.github.io/kria-apps-docs/kr260/linux_boot/ubuntu_22_04/build/html/docs/intro.html.
    b. At where you will :
        - Download image
        - Burn using Balena etcher
        - Update the boot firmware at KR260
        - And boot the KR260 with Ubuntu 22.04LTS.

3. **Connecting the Pmod Sensors with KR260 Robotics Starter Kit:**
    Below are the details for connection of Pmod sensors and modules at KR260.
    a. Pmod Acl - Accelerometer
        - Connect to Pmod1.
    b. Pmod TMP2 – Temperature sensor
        - Connect to Pmod3.
    c. Pmod GPIO – 8 bit LED
        - Connect to Pmod4.
    d. Pmod UART and PL Reset
        - Connect to Pmod2.

- You can follow following VIVADO Constraint section for connection.

```
# UART_txd PMOD #2 pin 2 (connect rx of the uart device to pin 2)
# UART_rxd PMOD #2 pin 4 (connect tx of the uart device to pin 4)
# Reset button → PMOD #2 pin 1
```

4. **Connect the Pmod-UART and KR260 UART on the board with PC.**
   a. You can use Mobaxterm/Teraterm in ***Windows*** or Gtkterm in ***Linux***.
   b. Connect the baudrate of 115200 for both of the UARTs

5. **KR260 Pmod sensors and connection:**

6. **Now boot the KR260 board.**
   a. After booting , you will start getting boot log from Ubuntu 22.04LTS into your PC/computer.
   b. After boot completes, you can enter the username – ubuntu and password – which you have setup in step2.

B. Clone Github Repository

Clone this github repository at the KR260-Ubuntu by running following command:

```
git clone https://github.com/LogicTronixInc/MicroBlaze-V-Zephyr-Kria-OpenAMP.git
```

C. Download and install the packages

- For downloading and installing kernel, firmware and host code files, please follow this readme - https://github.com/LogicTronixInc/MicroBlaze-V-Zephyr-Kria-OpenAMP/tree/main/Kria-Ubuntu#microblaze-v-zephyr-kria-openamp

D. Run the Application

Please follow this readme for running the application at KR260 Ubuntu (host app) and KR260 Zephyr (sensor fusion app) - https://github.com/LogicTronixInc/MicroBlaze-V-Zephyr-Kria-OpenAMP/tree/main/Kria-Ubuntu#running-the-application

Here are the steps details:

1. You can connect the KR260 via SSH (for multi terminal access) as like here:

2. Unload the kria app and re-load it. This process re-loads the Bitstream as well as Zephyr application (zephyr.elf) inside it.
3. Now, run the OpenAMP host app on the Kria-Ubuntu terminal.
4. Here, you must able to see the output as like in above picture.
